

After two years Covid finally got me so I am slowed down a bit but getting better.

I tried to get the transmission vectors put out their straight forward when the Monkey Pox presentation was live but your staff person did not take my question on clarification on the main transmission vector which still seems to be homosexual males. In fact when I was live she said that there were no questions. Yes I posted that comment so that people would have the proper amount of concern and not freak out.

Because I am still lacking energy because of covid recovery I missed todays meeting but I have now watched it and I have a concern that the needle exchange program has been going on here for almost 30 years yet no one thought to have a distinctive icon on the needles that are used so accurate data can be compiled on dirty returns. It appeared that a couple board members had questions too. If an icon was used and the people running the program collected the data then answers could be given instead of "I don't know" and guesses given on how many clients are actually being served and where because the logo shows up someplace.
